

For Immediate Release

## **SafeSourcing Releases New Purchase Order Software to Help Companies Streamline Spend Management Processes**

*SafeCatalog™ and SafePO™ offer a new way for companies to manage all aspects of the purchasing process from one place.*

Scottsdale, AZ – August 1, 2012 – Today SafeSourcing, a leader in eProcurement, announced the release of their latest SaaS delivered, cloud-based tools, SafeContract™ and SafePO™. Each tool features capabilities that are user friendly and available for companies to implement into their current processes by providing all the ordering, purchasing, billing, and shipping information into one place.

SafePO™ is a cloud based, SaaS delivered, Purchase Order Management system that allows users to create, approve, and fulfill orders quickly, easily, and safely. Users can track purchase order history by a variety of criteria, such as purchase order number, company, vendor, project number, or location.

SafePO™ provides a workflow for purchase orders that, once approved, will notify the intended supplier through an email that the order is ready for their review. With this tool, after the order has been received and processed, vendors submit an order acknowledgement, verifying that the order was successful. In addition, SafePO™ allows entry of vendor notes and private notes for additional data and information for the company's own use.

SafeCatalog™ is a tool that allows companies to consolidate the products and services they order into one online view for employees. This tool is easily customizable and allows users to create different catalogs for multiple departments within their organization. It also provides control over ordering by listing only approved vendors at negotiated rates. When integrated with the SafePO™ module, users can have their catalog orders automatically processed and entered into an online purchase order system that allows suppliers to be notified of the order once it has been approved. Catalogs can be populated with items from one or multiple suppliers and are presented in a way that includes descriptions and provides prices in one location. SafeCatalog™ provides

users the leverage to monitor and control spending through spending thresholds that ensure that users are receiving the correct price for all items.
